SellingPoint is an online publisher of AutoCAD training videos. AutoCAD is a commercial piece of software, costing \$895/user/year for the basic application, and \$1250/user/year for the best version, which includes all products from AutoCAD, AutoCAD LT, AutoCAD WS, DWG Xpress, AliasMesh, and AliasConnect. AutoCAD's business model includes the use of subscription licensing. In contrast to previous CAD software programs, AutoCAD licenses are typically not sold in single purchases, and instead are charged on a yearly basis. AutoCAD was developed by Autodesk (previously Computer Associates) and is compatible with a variety of operating systems. Initially, AutoCAD ran on a variety of operating systems, including MS-DOS, OS/2, VMS, Solaris, and Windows 3.1. Windows 95 and Windows NT versions of AutoCAD were also released. In 2006, Autodesk bought the Alias PowerCAD line of CAD applications and converted it into AutoCAD. In 2010, AutoCAD began support for OS X operating systems. In 2015, Autodesk released AutoCAD for iPad. In 2017, Autodesk launched the AutoCAD software as a service (SaaS) offerings. History 1982–1997: Computer Associates/Autodesk (the Alias Company) Origins and early development In the late 1970s, Arthur Stone, a consultant at the Lawrence Berkeley National Laboratory (LBL) in Berkeley, California, was working on a plan for a job-order system for CAD. The plan was to use the Flex/B++ language, the CAD software they were using at the time, to link the CAD program with the job-order system. The plan was that the CAD program would generate job order documents (job sheets) which could be used by the operators (users) of the CAD program. The LBL needed to generate job order documents for all of their documents produced, but the CAD operators could not view the job sheets or modify them without taking time off from their work. Stone's plan for a job-order system for CAD led to a full-time job at the CAD software company CAC Microcomputer Systems (CAC) in Menlo Park, California, in 1977. The purpose of the software he developed was to create a job-

Autodesk Exchange is a program that allows users to create and share custom workflows and work products. Applications included with AutoCAD LT can be extended to form a basis for third party AutoCAD applications or other software such as various integrated development environments and technical writing software. The underlying operating system of AutoCAD is an extension of the programming language AutoLisp, for example, drawing objects are instances of AutoLisp classes. The extension is accessible through the standard AutoLISP language. AutoCAD LT uses the VBA macro development language for customization and integration. The VBA macro development language is a similar subset of the Visual Basic for Applications programming language. Autodesk's integration tools provide the capability to extend AutoCAD without having to know AutoLISP or the programming language Visual Basic for Applications. The extension is made accessible through the AutoCAD API (Application Programming Interface). The extension is made accessible through the standard AutoLISP language. The AutoCAD API is a series of Application Programming Interface (API) functions that make it possible to develop applications with the AutoCAD platform. AutoCAD supports various standards to define objects, annotations, and layers, for example, three-dimensional drawing objects can be saved in the drawing as AEC (Architectural Electronic Construction). The AEC format is supported by all Autodesk CAD products. Dynamically created objects Autodesk's extension, AutoLISP, allows users to create objects dynamically at runtime, either with a user interface or programmatically. When a dynamic object is created, AutoLISP can make it possible to call the same functions as are available in a standard static object. As opposed to standard objects, dynamic objects can be created in any layer and are positioned in a specific location in the current view. The dynamic object can be saved as a static object or as a dynamic object. A dynamic object can be saved in a different drawing format than the one where the object was created, while a static object is saved as a static object in the same drawing file. Dynamic objects can also be saved as annotation, which are dynamic objects that are placed on a static or dynamic object. Dynamic objects are defined as a reference to an object of the class AutoLISP.DynamicObject. This object contains two methods: Create: that creates an object at runtime. Destroy: a1d647c40b

In recent years, a design rule of a semiconductor device has been miniaturized and a size of a contact hole and a via hole, which has conventionally been conventionally formed, has also become miniaturized. If the size of the contact hole or the via hole is small, however, a gap between interconnections is so narrow as to make it difficult to form a contact hole or a via hole. Conventionally, when the contact hole or the via hole is formed, the contact hole or the via hole is formed after a surface of a semiconductor substrate is planarized by a CMP method (Chemical Mechanical Polishing method). The planarization method is effective for miniaturization of a design rule and an increase of integration. However, the planarization method requires a polishing step, and the entire semiconductor substrate must be polished even a region where a wiring layer is formed in a later step. A region where the wiring layer is formed is disadvantageously thick. As described above, according to the planarization method, if a region of the wiring layer is formed thin, a gap between interconnections is so narrow that the contact hole or the via hole cannot be formed. As a result, it is difficult to make a design rule of the semiconductor device small, and the increase of integration is limited. There has been proposed a self-aligned contact technique to form a contact hole or a via hole without the above-mentioned planarization process. The technique is disclosed, for example, in Japanese Laid-Open Patent Publication No. 5-2208
