* # CHAPTER 4 # The Essentials THE ESSENTIALS AFTER APPROPRIATE MASTERING, you'll want to save and share your work in a format that's compatible with most sites. The big three are JPG, GIF, and PNG. The others also work, but they're more specialized formats. This chapter's got all the specifics on how to prepare your images for those situations. ## JPEG JPG stands for Joint Photographic Experts Group, which was a joint committee created by the National Institute of Standards and Technology (NIST) and the International Organization for Standardization (ISO) in the 1990s to create an industry standard image format. The format is the default format of both websites and users. JPG compresses an image and creates an optimized file size so that a Web server, desktop printer, or screen can display it. Despite its huge popularity, the downside of JPG is that it compresses images very efficiently, so if you save a high-resolution photo to JPG, it may be hard to view it on your computer later. The downside of JPG is the color depth. As of this writing, a maximum of 8 bit is the capacity on a computer monitor or screen, so if you're doing the bulk of your work on your computer, the maximum color depth is 256 colors, which isn't sufficient if you're working with a 24-bit or more file. In addition, JPG fails to preserve all of the color information in the original file, so some of the color detail may be lost in the process. JPEG never compresses a color photograph in the same way as it does monochrome images. For instance, a blue sky that's 99 percent of the colors is hard to compress.

According to the original white paper, the founders of Bitcoin intended the currency to be used as a decentralized means of moving money across the Internet. “Nakamoto argued that Peer-to-Peer Electronic Cash was the only security model in which transaction history could not be tampered with. The users of Bitcoin maintain the integrity of the history of the transactions, and thus provide protection against double-spending: one could not spend the same electronic cash more than once. This anti-counterfeiting feature of Bitcoin’s design is in contrast to the existing electronic cash schemes where the transaction history is stored in the hands of trusted third parties such as banks.” [Source] – Bitcoin addresses were created to allow people to send and receive payments using a cryptographic key known as a public key. With a public key, you can create a digital signature or

prove that you own a private key. Private keys are used to access your funds, and are linked to a “wallet”, which stores the key. Since transactions are cryptographically signed, they cannot be changed by the recipient after it has been sent, and cannot be changed by the sender without invalidating the signature. Transactions that are made by the use of the encryption keys are called “transactions”, and other transactions, such as the creation of new coins, are called “mining”. In 2010, Satoshi used the cover of anonymity and the pseudonym “Satoshi Nakamoto” in order to recruit many of the people involved in Bitcoin and later cryptocurrencies. In May 2014, the Economist speculated that Satoshi Nakamoto could be either an individual or group of individuals. But in 2013, the Canadian Journal of Law and Jurisprudence argued that Satoshi Nakamoto must be a pseudonym for at least one of the original developers. In 2014, two major credit card companies, Mastercard and Visa, announced that they would not process Bitcoin transactions for customers. In March 2018, Bitcoin.com reported that the Chinese government has closed down almost all of the 800 or so Bitcoin exchanges that have operated in the country. These events have left many people in the cryptocurrency space, who take the stance of Satoshi Nakamoto, believing that the original creators have been largely abandoned by their community. One of the ideas of Satoshi Nakamoto is that money should be decentralized and trustless. “Decentralization would occur when the consensus rules were such that the majority of the computational

The most widely used method for producing sodium hydroxide is based on the electrolysis of sodium chloride or brine. The product of such a process is a saturated solution of sodium hydroxide. This solution is generally produced by feeding such a solution into a crystallizer in which it accumulates and then it is separated out in a solid-liquid separation process, usually by gravity. This method requires the use of a large number of mechanical and electrical devices, which are both expensive and difficult to operate. It is known to produce sodium hydroxide by electrolysis of liquid caustic soda solutions, which is the basis for conventional electrolysis processes. While this method can be used for producing sodium hydroxide, the electrolysis of caustic soda solution is extremely expensive and needs considerable electrical energy. Recently, various organic polymers have been used as a separant in electrolysis cells. For instance, U.S. Pat. Nos. 5,248,449 and 5,556,879 describe the use of insoluble polymers as the separant in electrolysis cells producing sodium hydroxide. There, a high-purity aqueous alkali metal hydroxide solution is produced by an electrolysis process that uses an ion-exchange membrane as the separator. A polymer having an acidic functional group is used as the ion-exchange membrane. This technology is still on the preliminary stages, but the problems to be solved are numerous. A first problem consists in the fact that in fact one cannot operate a modern electrolysis cell in a complete carbonate or sodium carbonate medium (acid medium) because the ion-exchange membrane used as separator between the anode and cathode is sensitive to the presence of sulfite or carbonate and to its decomposition products such as sulfuric acid, carbon dioxide and bicarbonate. The latter can result in the destruction of the membranes due to swelling and the release of carbon dioxide which can be extracted and cause the degradation of the membrane. In order to avoid these problems, it is necessary to operate such cells in a medium with a relatively low concentration of bicarbonate and carbonate. Another problem lies in the fact that the polymers used as the separant have the disadvantages of being difficult to separate from the spent electrolyte and they are easily soluble in this spent electrolyte which requires extra costs. It is also necessary to use very pure monomers which are therefore very expensive

Search Recipes Making the Perfect Cherry Pie Thanksgiving is a time of plenty. You have all this delicious food coming from the kitchen of your loved ones, and plenty to eat and drink. If you're anything like me, the best part is finding that perfect pie. I always think we have a really nice Thanksgiving dinner with the pies, but my two favorite pies are the cherry pie and pumpkin pie. Both are pretty, and both go well with the rest of the dinner. I've been thinking about pie a lot lately. I didn't mean to. It just kind of comes naturally to me. I think it's because it's the holiday season, and everything is so delicious. I'm making a pumpkin pie crust this week and my sister is making a cherry pie crust. I've made cherry pie before, but I don't remember how I made it. I think the last time I made cherry pie was way back when I was working at a cafe, and I made a cherry pie the first day I worked there. It probably wasn't too fancy. I like to make things a bit fancy. I'm sure I'll share how I make my pie later. The other night I was thinking about summer and pie. One night I spent on the deck in my pajamas, with a bottle of rosé wine and a cherry pie. I'll spare you the details of the rest of the evening, but I will tell you that it was like a slice of cherry pie on the tongue and on the hand. I think it was both in the cup and the pie, and they went together perfectly. Last week was my friend's birthday, so I made her a cherry pie and I promised her that I'd make the pie for her this week, as well. It's been a while since I've made pie, and I'm looking forward to sharing the secrets with you. If I do, I will let you know. I've been thinking about pies a lot lately. I think it's because it's the holidays and everything is so delicious. I'm making pumpkin pie crust this week and my sister is making a cherry pie crust. I've made cherry pie before, but I don't remember how I made it. I think
