1. Files, panels, menus and windows. The main window of Photoshop is divided into three different areas. The left hand side contains the files, panels and menus of the file that's currently open. At the top is the area containing windows and menus. The tops of windows and menus are darker, similar to the non-editable backgrounds of documents in Pages, Keynote and Numbers. Everything else in the main window is editable. The middle of the main window contains the Layers panel. You can access it from the Window menu. Layers are images, shapes and types of layer functionality, which can be used to create complex images, to control how an image is created. 2. Import images from the camera or scanner You can import your photos from a digital camera or scanner into Photoshop using the Import feature. You can choose from any of your photos, including the most recent, or you can import from several types of formats. To import from your digital camera, make sure that the device is connected to the computer. Then open the Import feature. Click the Open button, then choose the photo you want to use. Import from a scanner. To import from a scanner, first connect the scanner to the computer using the computer's USB port. Click the Import button, then choose the type of image you want to import from the scanner's settings. 3. Use the tools and shortcuts. You can use some of the commands from the keyboard and mouse to alter images. You can use the keyboard or your mouse to activate tools in the image. For example, to add text to an image, hold down the Command (⌘ on a Mac) key and click the mouse to add text. You can add the same text to an image using the keyboard by pressing the shift key while typing the text you want to add. You can also add multiple lines of text by using the tab key instead of a mouse. To zoom in and out of images, you can use the keyboard's F-keys. On a Mac, press F5 for full-screen; on a PC, press the + or - key to zoom in or out. 4. Use basic editing tools to edit images. Editing images in Photoshop is done using the different tools on the canvas. These tools are used to add text, to draw shapes, to crop images, and to change their colors, brightness, 388ed7b0c7

. Thus, selective inactivation of NOX2 may protect the liver from the deleterious effects of hepatic iron accumulation. Among the NOX isoforms, NOX2, the major homolog of NOX4 and Nox1, is the key source of free radicals in the vasculature and endothelium under physiologic conditions \[@B51-ijms-19-02208\]. As outlined above, NOX2 is a significant contributor to the production of ROS in the liver and its inactivation protects the liver from iron-induced injury. We evaluated the effect of treatment with NOX2 inhibitor VAS2870 on HFE- and LMP7-mediated iron-induced hepatic injury. Treatment of mice with NOX2 inhibitor VAS2870 significantly attenuated hepatic injury, as evidenced by the significant decrease in ALT and AST levels and histologic evidence of preserved hepatic architecture. The beneficial effects of NOX2 inhibitor VAS2870 might be exerted via several mechanisms, including preservation of liver structure by preventing the formation of fibrotic areas and the enhancement of ROS scavenging, as depicted by the decreased serum ROS levels. Furthermore, the results of the present study indicated that the hepatic expression of NOX2 and ROS levels were strikingly reduced in *Nrf2*<sup>-/-</sup> and *LMP7*<sup>-/-</sup> mice fed with high iron diet, respectively. These findings are in agreement with previous reports that Nrf2 and LMP7 play an important role in iron metabolism through the regulation of ferroptosis \[@B6-ijms-19-02208\], \[@B13-ijms-19-02208\], and NOX2-derived ROS production in iron-induced hepatic injury \[@B50-ijms-19-02208\], \[@B51-ijms-19-02208\]. Interestingly, although the hepatic expression of NOX2 protein and ROS levels were reduced in the LMP7-deficient mice on a high iron diet, the NOX2 inhibitor VAS2870 treatment did not restore the elevated ROS levels in the liver, which might be due to the reduced oxidative stress in the liver and the increased liver antioxidant levels. However, the role of ROS in the induction of NOX2 has not been fully elucidated, and our findings further support the possibility that oxidative stress can increase NOX2
