Want more information? • Websites: • Google+: • Twitter: NK cell functional avidity is differentially associated with MHC class I haplotypes. During the early phase of infection, cytotoxic NK cells express low-avidity NKG2D receptors, whereas in the late phase of infection, higher-avidity NKG2D receptors are induced on NK cells, which have enhanced lytic activity. We recently showed that humans with missing KIR haplotype and NKG2C Bw4 epitope have increased affinity for their peptide-MHC class I complexes (PECs) resulting in higher avidity for cognate target cells. Here, we show that cells from healthy donors with a KIR haplotype carrying the KIR3DL05 epitope display significantly reduced PEC binding avidity. Furthermore, Bw4(-)KIR3DL05(+) NK cells from these donors were indeed less efficient at lysing KIR3DL05(+) target cells. In contrast, KIR2DL01(+)/KIR2DL2(+) NK cells derived from these donors displayed improved PEC binding avidity despite KIR2DL01(+)/KIR2DL2(+) NK cells lysing cells at levels comparable to healthy donors with the KIR3DL05 epitope. Thus, the expression of KIR3DL05 correlates with reduced PEC binding avidity, whereas KIR2DL01 correlates with enhanced PEC binding avidity. These observations strongly suggest that KIR3DL05 may be linked to lower functional avidity of NK cells, whereas KIR2DL01 may contribute to higher functional av
