Induction of SOX9 is accompanied by the downregulation of ERG. While these results suggest that SOX9 plays a role in prostate cell dedifferentiation, a recent study by Schmidt-Wohlgemuth et al. shows that SOX9 antagonizes ERG in prostate cancer [\[\[@pone.0153417.ref013\]\]](#). It will be interesting to determine if SOX9 influences ERG expression in non-prostate cells, including adipocytes. In this study we identified a series of transcription factors and signaling molecules that function in our adipogenic and dedifferentiating pathways. The findings provide evidence that androgen, known to increase adipocyte differentiation, also promotes an adipose phenotype and mitigates the propensity to dedifferentiate. These findings also suggest that modulating this pathway in other cell types may

have potential therapeutic value in reversing dedifferentiation-dependent phenotypes. We would like to thank the National Eye Institute (NEI) for generously funding this work. ca3bf1094
