[www.naturespot.com](http://www.naturespot.com) # Features of Photoshop CS3 There are many new features in Photoshop CS3 that make the application more user-friendly and powerful. Some of these newer features include Content Aware Scaling (CAS), the Free Transform tool, Content-Aware Fill, Liquify, Create Brushes, and the Adobe Kuler tool. ## Content Aware Scaling \*\*Content Aware Scaling\*\* is a feature of CS3 that enables users to modify an image as needed to make it look more "content-aware." With this tool, users can shift and resize an image to make it look more natural. If you have a group of photographs that are in the same frame, then you can use the Content Aware Scaling feature to merge them together without destroying the integrity of the individual photographs. Here's an example of a source image and the results of the Content Aware Scaling. To try this out, choose Image⇒ Image Processor⇒ Content Aware Scaling, and then select a thumbnail of the source photo to apply the new adjustments. The result is a new picture with a seamless transition. The way this works is as follows: This feature comes in handy if you have a series of pictures in the same frame and want to modify them to make them blend together seamlessly. By applying this technique, it is possible to get the same results as the Vue3D Photo Merge feature, but without all the additional steps. Also, no filters are required to achieve this. You can also use this feature for editing panoramas and other common panorama

## What's New in the Adobe Photoshop 2022?

Q: Computing the time complexity of this simple problem I am trying to compute the running time of the following problem (as an exercise). The problem is to find all quadruples  $(a,b,c,d)$  of positive integers for which the sum  $a+b+c+d$  is also a perfect square. I am given the hint that "it's easier to count up than down". To begin with, I thought the obvious solution was  $O(n^4)$ , since the number of quadruples with sum  $n$  is the squaresum function  $f(n) = n^2 + n$ . But then I figured out I could count up at a pace of  $O(n^2)$  and count down at a pace of  $O(n^2)$ , since for the amount of time you're spending up, there's always some number  $n'$  at which it gets quicker to count down. So now  $f(n) = O(n^2)$ , but the answer in the back tells me I'm off by a factor of  $2$ , and the answer is in fact  $O(n^2)$ . I've tried using the hint to count down a constant amount each time to prove the fact, but I get stuck and I'm not sure where to go from there. How should I proceed?

A: I'd like to encourage you to solve this using a simple divide and conquer approach. That is, what happens if we just try all possible combinations where  $a$  has to be less than  $b$  or  $c$ ? That gives you the values  $1,2,3,4$  which is  $5$  as you've pointed out. Then just stick to ranges  $[4,10]$  for  $a$  and  $[9,16]$  for  $b$ , and a similar range for  $c$  - each value in the range for each pair of  $a$  and  $b$  you've found will give you the values  $2b, 2b+1, 2b+2, 3b$  respectively. If you need to do that in  $O(n^2)$ , it's easy to write a program in  $\Theta(n)$  time with using an array to do the partitioning on and then a table to
