as the third amiga 3d program, it was either lightwave or imagine.

of course, the only real advantage that imagine had was that it was a full 3d package. but as it turned out, a majority of the public had no need for the full package. in fact, a huge number of users of lightwave wanted the cheaper plugins collection. so it was this that newtek sold, and it was the availability of this package that helped the product to take off. that's right, lightwave 3d still has the ability to use the original lightwave architecture and plugins.

lightwave has been known to be more stable than the current version. the features of lightwave are an open platform that work with the original plugins from newtek. although the plugins of lightwave 3d are less comprehensive, the speed is faster, the stability is higher, and the user interface is better. lightwave was designed with a plug-in architecture. it is comprised of three main sections: the director, the channel, and the plugins. the director is the application interface and contains a navigation and interface window, dopesheet, and keyframe editor. the channel is where the scene is stored. a channel can contain one or more instances of a scene, and is used as the data source for most things, such as the dopesheet, keyframe editor, and other scene-related tools. the plugins are external programs and are used to perform various 3d manipulations and other operations. the redesign version!

lightwave got a major redesign and a new element - the hub - was

introduced to synchronize files between layout and modeler automatically. there were numerous other changes, such as a new, user-editable menu system, the ability to have multiple layers in a single object along with the ability to keep them in sub-patch mode, rather than having to freeze when you saved out of modeler. first commercial application to introduce hdri, and the first incarnation of a new render engine at 192-bit. a first implementation of monte carlo and interpolated radiosity for lightwave3d. modeler introduced many new tools like skelegons, and upgraded many modifiers to interactive tools.

The combination of full professional video editing software and new technologies resulted in a product that could work with both professionals and prosumers. The software itself provided real time editing, compositing, color correction, and other features while the still had the ability to handle pro or consumer-level tasks. Numerous industry professionals can use LightWave today to create professional quality videos without needing the significant investment in a post-production environment that is required by other editing packages. It's relatively easy for a LightWave-savvy user to work right in the timeline or in the still section of the program, creating awesome footage with little to no effort, then export the result to a final file format of their choice, whether it be SD, HD, or 3D. About five years ago I, along with a few other fellow video editors, decided to start a new community video production blog called VideoHive.net that's been a lot of fun to watch grow. Lots of people reach out and ask for advice about how to get started in the video industry, and we all have lots of opinions on the different programs. So it seemed only appropriate that we have a poll on the best 3D software. I know that this is the first time that Enthusiast has posted a LightWave related video. I'm a huge fan of what JonnyH has been doing with the LightWave community so I was happy that he had time to create this. I hope you enjoy the video and that you will make time to check out his channel. His videos are always packed with information.
