E.M. Total Video Converter Command Line is a totally free application, available for both Windows and Linux platforms. The software is open source and it is distributed under the GNU General Public License. After being available for about two decades the most popular and currently most used audio and video codecs, both open-source and proprietary, are H.264 and AV1. It may come as a surprise that the “new” standard AV1 offers even more compression than its predecessor, H.264, and is also designed to be used as a standard from both mobile devices and high-end television devices. Most video-encoding applications, however, still only support H.264. This one supports both codecs, and it can even transcode a single file to both formats. It is fully integrated into your editor so you don’t need to use another application to do the conversion. Design Extended from the regular tool, the conversion dialog includes even more options for adjusting the output. You can set the profile, resolution, frame rate and audio bitrate as well as additional options such as the output’s name, quality, and setting the exact location of the output files. You can also use the output options to choose an output format to work with. There are no specific rules as to which format you should choose, but you can set the output to MP4, HEVC, VP9 or H.264. The audio section of the main interface includes an input field for the source file, a field for the desired output, and a slider which lets you control the volume. Limitations At the time of this writing, the converter does not support Blu-ray discs as well as 4K UHD videos. The same is true for Blu-ray discs, and you need to choose “DVD Video” as the output format in order to convert those. Editor The editor includes the most commonly used options for adjusting an output, just like the GUI. To add a watermark to a file, you need to select a size and position, and you can specify the transparency of the watermark. If you don’t like the watermark’s color, you can change it. The menus are mostly the same as those of the GUI, so we won’t go into details on that. In order to properly adjust the output, you need to
